COVID-19 Data Analysis Report

Report Requirements

Prepare a clear and well-organized report based on the COVID-19 dataset. Complete the following analysis using the specified columns and present your findings in tables.

Part 1: Overall Statistical Analysis

Calculate the following statistics for each of these columns: **Active, Confirmed, Deaths, and Recovered**.

- **Total:** The sum of all values.
- **Average:** The mean value across all countries.
- **Maximum Value:** The highest value recorded.

Part 2: Country-Level Analysis

For each category below, display the number of cases or deaths in every country, then identify the countries whose values are above the overall average for that category.

1. Active Cases

- Display the number of active cases in each country.
- Identify countries with active cases above the overall average.
- Highlight countries classified as **overactive**, if a separate threshold is provided.

2. Confirmed Cases

- Display the number of confirmed cases in each country.
- Identify countries with confirmed cases above the overall average.

3. Deaths

- Display the number of deaths in each country.
- Identify countries with death counts above the overall average.

4. Recovered Cases

- Display the number of recovered cases in each country.
- Identify countries with recovered cases above the overall average.

Final Deliverables

- Present the results in a clear and organized format.
- Include all calculated statistics and country-level results for the four categories.
- Use appropriate tables to make the findings easy to read and compare.

Note: “Above average” and “overactive” describe the same condition unless a separate threshold is defined for “overactive.”
